

High-intent demand is already on the wishlist; the leak is 30-day purchase

Myntra Growth. North star: share of users who purchase at least one item they wishlisted, within 30 days of that add.

Users heart with intent, then stall. Frequency and GMV sit on demand the platform already captured. The job is not more discovery. The job is closing a saved decision.

Constraint: no coupons, cashback, EORS timers, or invented discounts. Price-wait is real. We are not allowed to buy the conversion.

Submit these three

1. Discovery engine
2. Deployed MVP
3. This deck (PDF)

Concept prototype. Not the Myntra app. No login.

Conversion dies after save: revisit → pick a size → bag → pay

#	Product outcome	What must change	MVP?
P1	Revisit saved demand in 30d	Open wishlist again	Observe
P2	Still eligible	Size in stock	Observe; no silent size swap
P3	Intent, not bookmark	Detect. Do not nag moodboards	Still exploring bucket
P4	Close uncertainty in-app	Fit story + return/seal-tag on the saved SKU	PICKED
P5	Choose among substitutes	Fit + occasion compare, never discount %	PICKED
P6	Bag with a size	CTA names the size	Add M to bag
P7	Pay	Standard checkout	Out of prototype

Drop-off between Verdict open and size-accept is the product bug.

WhyWait ranks why they wait — not star ratings

Pipeline

1. Ingest public quotes with source URLs (stores, Reddit, hauls, complaints).
2. Extract job, barrier, genuine vs bookmark, workaround, severity, metric proximity.
3. Score = frequency × severity × proximity × non-monetary solvability (1–5).
4. Compare opportunities. Disqualify monetary. Pick solvability ≥ 4 .

A 5-star “sized up and loved it” is still fit_uncertainty. Stars are not the unit. Blocking an already saved SKU inside 30 days is the unit.

Test this slide

github.io/myntra-verdict/discovery

Ranked bets · 2×2 · compare fit vs EORS · Try a review (Fit / Return / Sale / Bookmark)

Works with no API key. Same nine opportunities as this table. A 5-star “sized up” is still fit uncertainty.

Fit uncertainty + return/seal-tag fear beat every lever we are allowed to pull

Barrier	F	S	M	N	Score	Call
Fit uncertainty	5	5	5	5	625	PICKED
Return / seal-tag fear	4	5	5	4	400	CO-PRIMARY
Size-chart distrust	4	4	5	4	320	Input to fit story
Comparison paralysis	3	3	4	4	144	Compare strip
Budget / EORS wait	5	4	5	1	100	DISQUALIFIED
Bookmark-only	4	2	2	2	32	Quarantine, don't convert

Sale-wait is frequent. We ranked it. We refused it. N=1 under the constraint.

Six metro working women leave Myntra to decide if it will fit

Who	Still intend?	Freeze	Outside the app
Ananya, 27, Bengaluru	Work shirt, trousers — yes	PDP size story gone on wishlist	WhatsApp + office hauls
Riya, 25, Mumbai	One ethnic set in 18 days	Exchange-only, seal-tag	Instagram, family chat, store touch
Meera, 30, Delhi	One of three trousers	Charts are theatre	Google + tape on a kept pair
Priya, 28, Pune	Kurta yes; saree no	Ethnic size ≠ top size	Petite hauls, sister
Kavya, 24, Hyderabad	~10 of 96 items	Bookmark pile	Hauls, then forgets
Sneha, 32, Gurugram	High, budget exists	Return time-cost	Forwards PDP, still stalls

Full notes: interview notes. They do not need a coupon. They need a decision object.

The wishlist stores intent; it does not close fit or return risk

Segment. Metro working women 24–32. 15+ saved items. Workwear plus occasion.

Outcome. Raise 30-day wishlist → purchase via revisit → confident size → bag.

Root cause. Size & Fit Intelligence and Maya live on PDP/search. That explanation does not travel with the saved card. Return/seal-tag is an icon, not a sentence. Uncertainty is resolved off-platform, slowly, past 30 days.

Workarounds. WhatsApp photos, YouTube hauls, two-size orders, wait for EORS to offset return risk, abandon.

User value. Decide in-app. Skip a failed try-on and a reverse-pickup Sunday.

Business value. Convert demand already saved. Frequency and GMV without paying for conversion.

Verdict sits on the saved item — not another PDP try-on, not EORS

Not filters

Clutter is real (score 72). Hygiene does not pick a size. A tidy graveyard is still a graveyard.

Not PDP try-on

Myntra already ships size explainability on ~85% of eligible apparel and is building Try On Me. The gap is post-save. Advice must persist on the hearted card.

Not discounts

EORS wait ranks high and is illegal for this brief. Sale as risk-offset is a symptom of return fear, not the product we ship.

Verdict is a decision object: fit analog (kept / exchanged / returned) + suggested size with “not a guarantee” + return class in words + saved-substitute compare on fit and occasion.

Three buckets, one decision: Ready / Check fit / Still exploring

Bucket	Signal (word + shape, not colour alone)	Rule	CTA
READY	Filled chip + word READY (blue)	Intent + high fit analog + easy return	Add M to bag
CHECK FIT	Triangle chip + words CHECK FIT (amber)	New brand, mixed reviews, exchange-only	See Verdict
STILL EXPLORING	Dashed chip + STILL EXPLORING (gray)	Bookmark, seal-tag occasion, OOS usual size	Keep saving — no bag push

Prototype: MVP · demo sizes loaded · See Verdict on Check fit. Engine: WhyWait.

Win size-accepted bag-add; keep size-related returns flat

Metric	Type	Definition	Why
30d WL user purchase	Lagging / NS	User bought ≥ 1 of their WL items within 30d of that add	The brief
Size-accepted bag-add	Leading	Bag-add from Verdict with a confirmed size / Verdict opens	Weekly proxy for NS
Verdict open rate	Leading	Intent revisits that open the decision object	Did we put it on the path?
Compare completed	Leading	Finished substitute compare among ≥ 2 similar saves	Paralysis
Time-to-bag after revisit	Leading	Median minutes revisit $\rightarrow$ bag from Verdict	In-app vs YouTube loop
Size/fit return rate	Guardrail	Size-reason returns on Verdict-bagged lines vs control	Overconfidence fakes NS
Over-nudge	Guardrail	Bag CTAs shown to Still exploring	Must be ~ 0

It fails if we fake certainty or nag people who were only bookmarking

Risk	Why it kills the metric	Mitigation
Overconfident fit	30d purchase then reverse pickup	“Likely”, never guaranteed. Return card always. Weak analog → Check fit
Bookmark spam	Users ignore Wishlist	Exploring has no primary bag CTA. One-tap Just saving
“We already have size AI”	Leadership kills the bet	Post-save object + policy in words + saved-substitute compare
Price-wait is actually #1	Wrong problem narrative	WhyWait ranks it DISQUALIFIED in public
Prototype looks like phishing	Trust, App Store risk	Always-on “Not the Myntra app” bar. No login, no UPI

If this still feels off, don’t bag it. Brands still cut differently. Kept ≠ looked perfect.
